VoiceOps 2026: ZentroMart Support Agent

Technical summary — rebuilt from user-provided brief and dataset files.

Step 1: LLM prompting

OpenAI-compatible chat API with a system prompt identifying the assistant as AI. Real answer accuracy has not been measured.

Step 2: Retrieval

TF-IDF retrieval over current knowledge documents, excluding the superseded returns policy. Source filenames are retained. This is a baseline rather than embedding-vector RAG.

Step 3: Conversation and tools

Multi-turn context and verified order lookup via the supplied mock tool. Ticket helper is exposed, but autonomous ticket routing is not implemented.

Step 4: Gnani voice

GnaniSTTClient and GnaniTTSClient with explicit timbre-v2.5 model; audio batch command and Gradio interface. Live API behavior is untested.

Evaluation and limitations

No live LLM or speech scores are claimed. A valid OpenAI-compatible API key, Gnani API key, recorded demo, and evaluation against practice cases are needed before final submission.
